How to Learn Evolutionary Biology

Media and Supplements

UNIT I An Idea that Changed the World

Chapter 1 Evolutionary Biology

Nothing in Biology Makes Sense except in the Light of Evolution”

What Is Evolution? Is It Fact or Theory?

The Evolution of Evolutionary Biology

Before Darwin

Charles Darwin

Darwin’s evolutionary theory

Evolutionary biology after Darwin

The evolutionary synthesis

Evolutionary biology since the synthesis

How Evolution Is Studied

Philosophical Issues

Ethics, religion, and evolution

Summary

Chapter 2 The Tree of Life

The Tree of Life, from Darwin to Today

Phylogenetic Trees

Inferring phylogenies: An introduction

Variations on the Phylogenetic Theme

Branches of a phylogenetic tree sometimes rejoin

Not only organisms have “phylogenies”

Phylogenetic Insights into Evolutionary History

Inferring the history of character evolution

Estimating time of divergence

Patterns of evolution

Summary

Chapter 3 Natural Selection and Adaptation

Adaptive Evolution Observed

Natural Selection

The meaning of natural selection

Natural selection and chance

The effective environment depends on the organism

Levels of Selection

Selfish genes and unselfish behaviors

Selection of organisms and groups

Species selection

The Nature of Adaptations

Selection of and selection for

Recognizing adaptations

Imperfections and Constraints

Natural Selection and the Evolution of Diversity

What Not To Expect of Natural Selection

Summary

UNIT II How Evolution Works

Chapter 4 Mutation and Variation

The Machinery of Inheritance

The Inheritance of Variation

Gene mixing by segregation

Gene mixing by recombination

Gene mixing with asexual inheritance

Mutation: The Ultimate Source of Variation

Point mutations

Structural mutations

Rates and Effects of Mutations

Mutation rates

Effects of mutations

Germ line mutations and somatic mutations

Is Mutation Random?

Nongenetic Inheritance

Summary

Chapter 5 The Genetical Theory of Natural Selection

Natural Selection and Evolution in Real Time

Evolution by Selection and Inheritance

Fitness: The Currency of Selection

Positive Selection: The Spread of Beneficial Mutations

The rate of adaptation

Chance and adaptation: The probability that a beneficial mutation spreads

Evolutionary Side Effects

Hitchhiking: When one allele goes for a ride with another
When Selection Preserves Variation
Overdominance
Other forms of balancing selection
Selection That Favors the Most Common
Underdominance: When heterozygotes suffer
Positive frequency-dependent selection
The Evolution of a Population's Mean Fitness
The fundamental theorem of natural selection and the adaptive landscape
Deleterious Mutations
A mutation-selection balance
The mutation load
Summary
Chapter 6 Phenotypic Evolution
Genotypes and Phenotypes
Fitness Functions Describe Selection on Quantitative Traits
Measuring the Strength of Directional Selection
Evolution by Directional Selection
When genes interact: Dominance and epistasis
Adaptation from standing genetic variation versus new mutations
Can adaptation rescue species from extinction?
Artificial Selection
Correlated Traits
Constraints and trade-offs
The causes of genetic correlations
Phenotypic Plasticity
The Genetic Architecture of Quantitative Traits
Quantitative trait loci
The genetics of quantitative traits
Summary
Chapter 7 Genetic Drift: Evolution at Random
What Is Random Genetic Drift?
The Genealogy of Genes
How Strong Is Genetic Drift?
Populations that change in size
Drift and Genetic Variation within Species
Estimating population size

Genetic Drift and Natural Selection
Crossing an adaptive valley by drift
The fate of beneficial mutations in large populations
The Evolution of Differences among Species
The neutral theory of molecular evolution
Searching the Genes for Signatures of Adaptation
Synonymous versus nonsynonymous differences
The MK test
Divergence among populations
Summary
Chapter 8 Evolution in Space
Patterns in Space
Gene Flow
How is gene flow measured?
Genetic Divergence between Populations
Gene Flow and Selection
Tension zones
Gene Flow and Drift
Gene flow, local adaptation, and drift
The Evolution of Dispersal
The Evolution of Species' Ranges
Summary
Chapter 9 Species and Speciation
What Are Species?
Reproductive Isolation
Prezygotic barriers
Postzygotic barriers
How fast does reproductive isolation evolve?
The Causes of Speciation
The Geography of Speciation
Allopatric speciation
Sympatric speciation
Parapatric speciation
The Genomics of Speciation
Summary
UNIT III Products of Evolution: What Natural Selection Has Wrought
Chapter 10 All About Sex
What Are Females and Males?

Sexual Selection

Why are males sexually selected?

Sexual selection by male-male competition

Sexual selection by female choice

Sexual selection in flowering plants

Sex Ratios

Why Sex?

Advantages to sex in changing environments

Selective interference favors sex and recombination

Selfing and Outcrossing

Summary

Chapter 11 How to Be Fit

Life History Traits as Components of Fitness

Costs of reproduction

Fitness in age-structured populations

Senescence

Evolution of the Population Growth Rate and Density

Diverse life histories

Number of offspring

Life histories and mating strategies

Specialists and Generalists

Advantages of specialization

Specialization without trade-offs

Experiments on niche evolution

Summary

Chapter 12 Cooperation and Conflict

The Costs and Benefits of Interacting

Social Interactions and Cooperation

Cooperation among Unrelated Individuals

Reciprocity

Shared Genes and the Evolution of Altruism

Spite

Conflict and Cooperation in Close Quarters: The Family

Conflict between mates

Murder in the family

Parent-offspring conflict

Eusocial animals: The ultimate families

Levels of Selection

Selfish DNA
Selfish mitochondria
Group selection
Cooperation and Major Evolutionary Transitions
Summary
Chapter 13 Interactions among Species
Coevolution and Interactions among Species
The Evolution of Enemies and Victims
Aposematism and mimicry
Plants and herbivores
Parasite-host interactions and infectious disease
Mutualisms
The Evolution of Competitive Interactions
Evolution and Community Structure
Summary
Chapter 14 The Evolution of Genes and Genomes
The Birth of a Gene
Gene families
The Death of a Gene
Evolution of Protein-Coding Genes
Evolution of coding regions by genetic drift
Evolution of coding regions by positive selection
Evolution of Gene Expression
Gene Structure
Chromosome Evolution
Fissions, fusions, and the evolution of chromosome number
Inversions and the evolution of chromosome structure
Evolution of Genome Size and Content
Genomes large and small
Genetic parasites and transposable elements
Routes to the evolution of the smallest and largest genomes
Summary
Chapter 15 Evolution and Development
Comparative Development and Evolution
Gene Regulation
Hox genes and the genetic toolkit
Developmental-Genetic Bases of Phenotypic Evolution
regulatory mutations

Evolution by
regulatory mutations
Evolution by
Overview: The genetics and development of phenotypic evolution
Evolvability and Developmental Pathways
Constraints on Adaptive Evolution
Phenotypic Plasticity and Canalization
Does phenotypic plasticity contribute to evolution?
Summary
UNIT IV Macroevolution and the History of Life
Chapter 16 Phylogeny: The Unity and Diversity of Life
Inferring Phylogenies
Why estimating phylogenies can be hard
Methods for estimating phylogenies
How Do We Use Phylogenies?
Dating evolutionary events
Discovering the history of genes and cultures
Reconstructing ancestors
Studying adaptations: The comparative method
Classification
Summary
Chapter 17 The History of Life
Some Geological Fundamentals
The fossil record
Before Life Began²
The Emergence of Life
Precambrian Life
The Cambrian Explosion and the Origins of Animal Diversity
Paleozoic Life
The colonization of land
Paleozoic life on land
The end-Permian mass extinction
Mesozoic Life
The Cenozoic Era
The modern world takes shape
The adaptive radiation of mammals
Pleistocene events
Summary

Chapter 18 The Geography of Evolution

Biogeographic Evidence for Evolution

Major Patterns of Distribution

Historical factors affecting geographic distributions

Historical Explanations of Geographic Distributions

Vicariance

Dispersal

Phylogeography

Geographic Range Limits: Ecology and Evolution

Geographic Patterns of Diversity

Summary

Chapter 19 The Evolution of Biological Diversity

Estimating and Modeling Changes in Biological Diversity

Studying diversity in the fossil record

Diversity through the Phanerozoic

Rates of origination and extinction

Mass extinctions

Phylogenetic Studies of Diversity

The shapes of phylogenies

Does Species Diversity Reach Equilibrium?

Summary

Chapter 20 Macroevolution: Evolution above the Species Level

The Origin of Major New Forms of Life

The origin of mammals

Gradualism and Saltation

The Evolution of Novelty

Incipient and novel features: Permissive conditions and natural selection

Complex characteristics

Homology and the emergence of novel characters

From Microevolution to Macroevolution

Rates of evolution

Gradualism and punctuated equilibria

Speciation and phenotypic evolution

Trends, Predictability, and Progress

Trends: Kinds and causes

Are there major trends in the history of life?

Predictability and contingency in evolution

The question of progress

Summary

UNIT V Evolution and Homo sapiens

Chapter 21 The Evolutionary Story of

Where Did We Come From?

Our closest living relatives

How humans differ from other apes

Our ancestry: Hominins through time

The Arrival of

The human history of hybridization

The diversity of human populations

Brain and Language

Diet and Agriculture: A Revolution in Our World

Natural Selection, Past and Present

Our genetic loads

Natural selection and evolution in real time

Evolutionary mismatches

The Evolution of Culture

Summary

Chapter 22 Evolution and Society

Creationism and Science

Creationism

The nature of science

The Evidence for Evolution

The fossil record

Phylogenetic and comparative studies

Genes and genomes

Biogeography

Failures of the argument from design

Evolution, and its mechanisms, observed

The Uses and Implications of Evolutionary Science

Evolution by natural selection: A broad and flexible concept

Practical applications of evolutionary science

Using organisms' adaptations

Agriculture and natural resources

Conservation

Health and medicine

Evolution and Human Behavior

Variation in cognitive and behavioral traits

Human behavior: Evolution and culture

Understanding nature and humanity

Summary

Appendix: A Statistics Primer

Probability Distributions

Descriptive Statistics

Estimation

Testing Hypotheses

Likelihood

Bayesian Inference

Summary

Glossary
