

Acknowledgements

My warmest appreciation must go to Professor Hermann Haken for inviting me to write this book for the Springer Series in Synergetics, and for helping support a sabbatical leave in Stuttgart in 1979–1980 where I did most of the initial exploration of the subject and commenced writing the book.

The physical production of the manuscript would not have been possible without the thoroughness of Christine Coates, whose ability to produce a beautiful typescript, in spite of my handwriting and changes of mind, has never ceased to arouse my admiration. The thorough assistance of Moira Steyn-Ross in checking formulae and the consistency of the manuscript has been a service whose essential nature can only be appreciated by an author.

Many of the diagrams, and some computations, were prepared with the assistance of Craig Savage, for whose assistance I am very grateful.

To my former colleagues and students at the University of Waikato must go a considerable amount of credit for much of the work in this book; in particular to the late Bruce Liley, whose encouragement and provision of departmental support I appreciated so much. I want to express my appreciation to the late Dan Walls who first introduced me to this field, and with whom I enjoyed a fruitful collaboration for many years; to Howard Carmichael, Peter Drummond, Ken McNeil, Gerard Milburn, Moira Steyn-Ross, and above all, to Subhash Chaturvedi, whose insights into and knowledge of this field have been of particular value.

Since I first became interested in stochastic phenomena, I have benefited greatly from contact with a large number of people, and in particular I wish to thank Ludwig Arnold, Robert Graham, Siegfried Grossman, Fritz Haake, Pierre Hohenberg, Werner Horsthemke, Nicco van Kampen, the late Rolf Landauer, René Lefever, Mohammed Malek-Mansour, Gregoire Nicolis, Abraham Nitzan, Peter Ortoleva, John Ross, Friedrich Schlögl, Urbaan Titulaer and Peter Zoller

In preparing Chap. 15 of this edition I was greatly helped by discussions with Peter Drummond, whose expertise on numerical simulation of stochastic differential equations has been invaluable, and by Ashton Bradley, who carefully checked the both content and the proofs of this edition.

The extract from the paper by Albert Einstein which appears in Sect. 1.2.1 is reprinted with the permission of the Hebrew University, Jerusalem, Israel, who hold the copyright.

The diagram which appears as Fig. 1.3 b) is reprinted with permission of Princeton University Press.

Contents

1. A Historical Introduction	1
1.1 Motivation	1
1.2 Some Historical Examples	2
1.2.1 Brownian Motion	2
1.2.2 Langevin's Equation	6
1.3 The Stock Market	8
1.3.1 Statistics of Returns	8
1.3.2 Financial Derivatives	9
1.3.3 The Black-Scholes Formula	10
1.3.4 Heavy Tailed Distributions	10
1.4 Birth-Death Processes	11
1.5 Noise in Electronic Systems	14
1.5.1 Shot Noise	14
1.5.2 Autocorrelation Functions and Spectra	18
1.5.3 Fourier Analysis of Fluctuating Functions: Stationary Systems	19
1.5.4 Johnson Noise and Nyquist's Theorem	20
2. Probability Concepts	23
2.1 Events, and Sets of Events	23
2.2 Probabilities	24
2.2.1 Probability Axioms	24
2.2.2 The Meaning of $P(A)$	25
2.2.3 The Meaning of the Axioms	25
2.2.4 Random Variables	26
2.3 Joint and Conditional Probabilities; Independence	27
2.3.1 Joint Probabilities	27
2.3.2 Conditional Probabilities	27
2.3.3 Relationship Between Joint Probabilities of Different Orders	28
2.3.4 Independence	28
2.4 Mean Values and Probability Density	29
2.4.1 Determination of Probability Density by Means of Arbitrary Functions	30
2.4.2 Sets of Probability Zero	30
2.5 The Interpretation of Mean Values	31
2.5.1 Moments, Correlations, and Covariances	32
2.5.2 The Law of Large Numbers	32
2.6 Characteristic Function	33
2.7 Cumulant Generating Function: Correlation Functions and Cumulants	34
2.7.1 Example: Cumulant of Order 4: $\langle\langle X_1 X_2 X_3 X_4 \rangle\rangle$	36
2.7.2 Significance of Cumulants	36
2.8 Gaussian and Poissonian Probability Distributions	37

2.8.1	The Gaussian Distribution	37
2.8.2	Central Limit Theorem	38
2.8.3	The Poisson Distribution	39
2.9	Limits of Sequences of Random Variables	40
2.9.1	Almost Certain Limit	40
2.9.2	Mean Square Limit (Limit in the Mean)	41
2.9.3	Stochastic Limit, or Limit in Probability	41
2.9.4	Limit in Distribution	41
2.9.5	Relationship Between Limits	41
3.	Markov Processes	42
3.1	Stochastic Processes	42
3.1.1	Kinds of Stochastic Process	42
3.2	Markov Process	43
3.2.1	Consistency—the Chapman-Kolmogorov Equation	44
3.2.2	Discrete State Spaces	44
3.2.3	More General Measures	45
3.3	Continuity in Stochastic Processes	45
3.3.1	Mathematical Definition of a Continuous Markov Process	46
3.4	Differential Chapman-Kolmogorov Equation	47
3.4.1	Derivation of the Differential Chapman-Kolmogorov Equation	48
3.4.2	Status of the Differential Chapman-Kolmogorov Equation	51
3.5	Interpretation of Conditions and Results	51
3.5.1	Jump Processes: The Master Equation	51
3.5.2	Diffusion Processes—the Fokker-Planck Equation	52
3.5.3	Deterministic Processes—Liouville's Equation	54
3.5.4	General Processes	55
3.6	Equations for Time Development in Initial Time—Backward Equations	55
3.7	Stationary and Homogeneous Markov Processes	56
3.7.1	Ergodic Properties	57
3.7.2	Homogeneous Processes	60
3.7.3	Approach to a Stationary Process	60
3.7.4	Autocorrelation Function for Markov Processes	63
3.8	Examples of Markov Processes	65
3.8.1	The Wiener Process	65
3.8.2	The Random Walk in One Dimension	68
3.8.3	Poisson Process	71
3.8.4	The Ornstein-Uhlenbeck Process	72
3.8.5	Random Telegraph Process	75

4.	The Ito Calculus and Stochastic Differential Equations	77
4.1	Motivation	77
4.2	Stochastic Integration	79
4.2.1	Definition of the Stochastic Integral	79
4.2.2	Ito Stochastic Integral	81
4.2.3	Example $\int_{t_0}^t W(t')dW(t')$	81
4.2.4	The Stratonovich Integral	82
4.2.5	Nonanticipating Functions	82
4.2.6	Proof that $dW(t)^2 = dt$ and $dW(t)^{2+N} = 0$	83
4.2.7	Properties of the Ito Stochastic Integral	85
4.3	Stochastic Differential Equations (SDE)	88
4.3.1	Ito Stochastic Differential Equation: Definition	89
4.3.2	Dependence on Initial Conditions and Parameters	91
4.3.3	Markov Property of the Solution of an Ito SDE	92
4.3.4	Change of Variables: Ito's Formula	92
4.3.5	Connection Between Fokker-Planck Equation and Stochastic Differential Equation	93
4.3.6	Multivariable Systems	95
4.4	The Stratonovich Stochastic Integral	96
4.4.1	Definition of the Stratonovich Stochastic Integral	96
4.4.2	Stratonovich Stochastic Differential Equation	96
4.5	Some Examples and Solutions	99
4.5.1	Coefficients without x Dependence	99
4.5.2	Multiplicative Linear White Noise Process—Geometric Brownian Motion	100
4.5.3	Complex Oscillator with Noisy Frequency	101
4.5.4	Ornstein-Uhlenbeck Process	103
4.5.5	Conversion from Cartesian to Polar Coordinates	104
4.5.6	Multivariate Ornstein-Uhlenbeck Process	105
4.5.7	The General Single Variable Linear Equation	108
4.5.8	Multivariable Linear Equations	110
4.5.9	Time-Dependent Ornstein-Uhlenbeck Process	111
5.	The Fokker-Planck Equation	113
5.1	Probability Current and Boundary Conditions	114
5.1.1	Classification of Boundary Conditions	116
5.1.2	Boundary Conditions for the Backward Fokker-Planck Equation	116
5.2	Fokker-Planck Equation in One Dimension	117
5.2.1	Boundary Conditions in One Dimension	118
5.3	Stationary Solutions for Homogeneous Fokker-Planck Equations	120
5.3.1	Examples of Stationary Solutions	122
5.4	Eigenfunction Methods for Homogeneous Processes	124
5.4.1	Eigenfunctions for Reflecting Boundaries	124
5.4.2	Eigenfunctions for Absorbing Boundaries	126

5.4.3	Examples	126
5.5	First Passage Times for Homogeneous Processes	130
5.5.1	Two Absorbing Barriers	130
5.5.2	One Absorbing Barrier	132
5.5.3	Application—Escape Over a Potential Barrier	133
5.5.4	Probability of Exit Through a Particular End of the Interval	135
6.	The Fokker-Planck Equation in Several Dimensions	138
6.1	Change of Variables	138
6.2	Stationary Solutions of Many Variable Fokker-Planck Equations	140
6.2.1	Boundary Conditions	140
6.2.2	Potential Conditions	141
6.3	Detailed Balance	142
6.3.1	Definition of Detailed Balance	142
6.3.2	Detailed Balance for a Markov Process	143
6.3.3	Consequences of Detailed Balance for Stationary Mean, Autocorrelation Function and Spectrum	144
6.3.4	Situations in Which Detailed Balance must be Generalised	144
6.3.5	Implementation of Detailed Balance in the Differential Chapman-Kolmogorov Equation	145
6.4	Examples of Detailed Balance in Fokker-Planck Equations	149
6.4.1	Kramers' Equation for Brownian Motion in a Potential	149
6.4.2	Deterministic Motion	152
6.4.3	Detailed Balance in Markovian Physical Systems	153
6.4.4	Ornstein-Uhlenbeck Process	153
6.4.5	The Onsager Relations	155
6.4.6	Significance of the Onsager Relations—Fluctuation-Dissipation Theorem	156
6.5	Eigenfunction Methods in Many Variables	158
6.5.1	Relationship between Forward and Backward Eigenfunctions	159
6.5.2	Even Variables Only—Negativity of Eigenvalues	159
6.5.3	A Variational Principle	160
6.5.4	Conditional Probability	161
6.5.5	Autocorrelation Matrix	161
6.5.6	Spectrum Matrix	162
6.6	First Exit Time from a Region (Homogeneous Processes)	163
6.6.1	Solutions of Mean Exit Time Problems	164
6.6.2	Distribution of Exit Points	166
7.	Small Noise Approximations for Diffusion Processes	169
7.1	Comparison of Small Noise Expansions for Stochastic Differential Equations and Fokker-Planck Equations	169
7.2	Small Noise Expansions for Stochastic Differential Equations	171
7.2.1	Validity of the Expansion	174
7.2.2	Stationary Solutions (Homogeneous Processes)	175

7.2.3	Mean, Variance, and Time Correlation Function	175
7.2.4	Failure of Small Noise Perturbation Theories	176
7.3	Small Noise Expansion of the Fokker-Planck Equation	178
7.3.1	Equations for Moments and Autocorrelation Functions	180
7.3.2	Example	182
7.3.3	Asymptotic Method for Stationary Distribution	184
8.	The White Noise Limit	185
8.1	White Noise Process as a Limit of Nonwhite Process	185
8.1.1	Formulation of the Limit	186
8.1.2	Generalisations of the Method	189
8.2	Brownian Motion and the Smoluchowski Equation	192
8.2.1	Systematic Formulation in Terms of Operators and Projectors	194
8.2.2	Short-Time Behaviour	195
8.2.3	Boundary Conditions	197
8.2.4	Evaluation of Higher Order Corrections	198
8.3	Adiabatic Elimination of Fast Variables: The General Case	202
8.3.1	Example: Elimination of Short-Lived Chemical Intermediates	202
8.3.2	Adiabatic Elimination in Haken's Model	206
8.3.3	Adiabatic Elimination of Fast Variables: A Nonlinear Case	210
8.3.4	An Example with Arbitrary Nonlinear Coupling	214
9.	Beyond the White Noise Limit	216
9.1	Specification of the Problem	217
9.1.1	Eigenfunctions of L_1	218
9.1.2	Projectors	218
9.2	Bloch's Perturbation Theory	219
9.2.1	Formalism for the Perturbation Theory	220
9.2.2	Application of Bloch's Perturbation Theory	222
9.2.3	Construction of the Conditional Probability	223
9.2.4	Stationary Solution $P_s(x, p)$	226
9.2.5	Examples	226
9.2.6	Generalisation to a system driven by several Markov Processes	228
9.3	Computation of Correlation Functions	230
9.3.1	Special Results for Ornstein-Uhlenbeck $p(t)$	232
9.3.2	Generalisation to Arbitrary Gaussian Inputs	232
